

# SQL Server Configuration

In this lab I was able to install SQL server and SQL Server Management studio. So after SSMS installation I was able to connect to a SQL server and create tables from written queries.

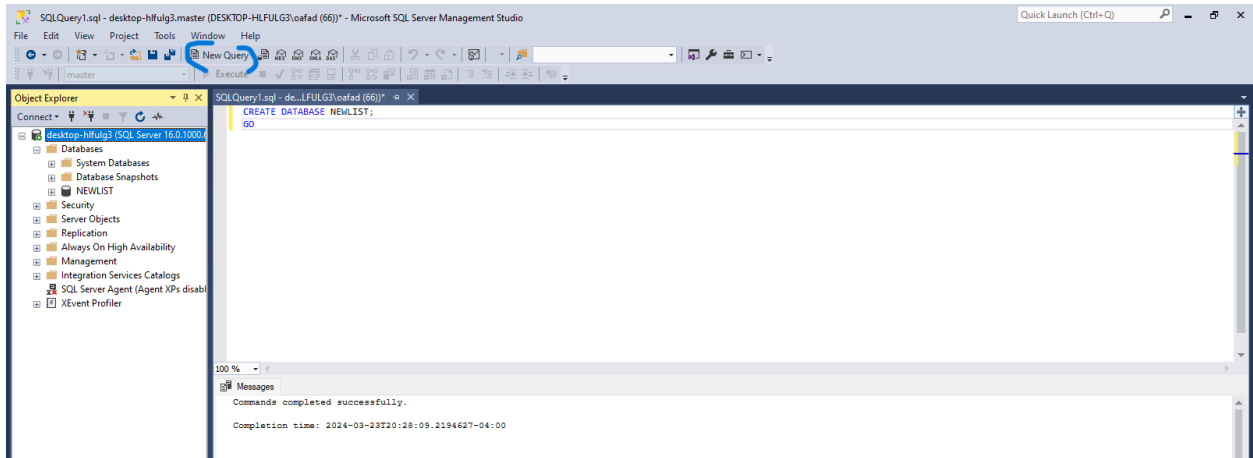

Installed SQL Server and SQL Management studio:

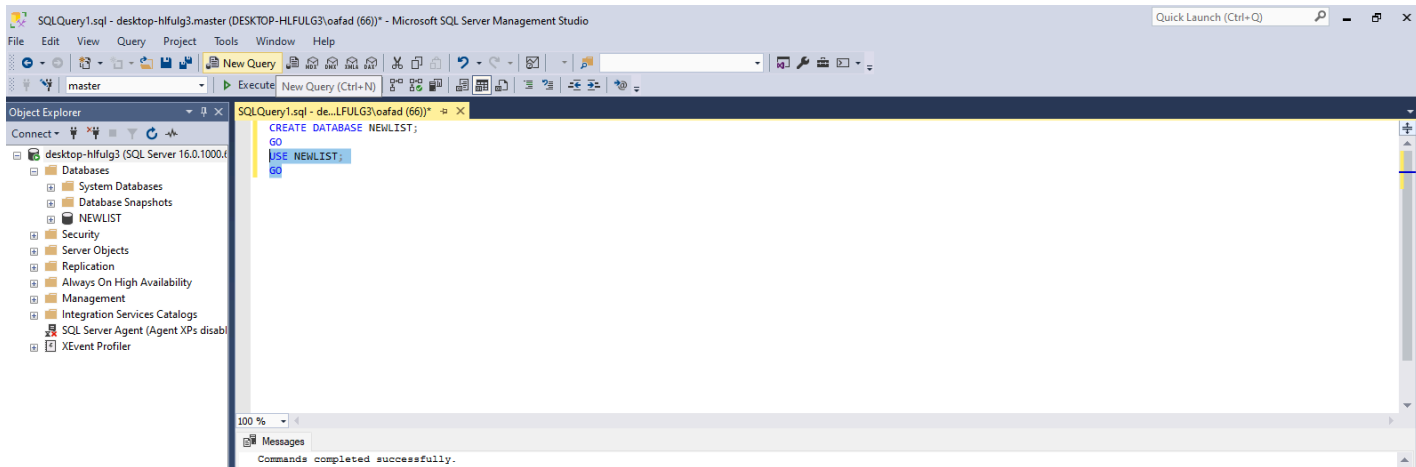

SSMS installed and running to ensure connection

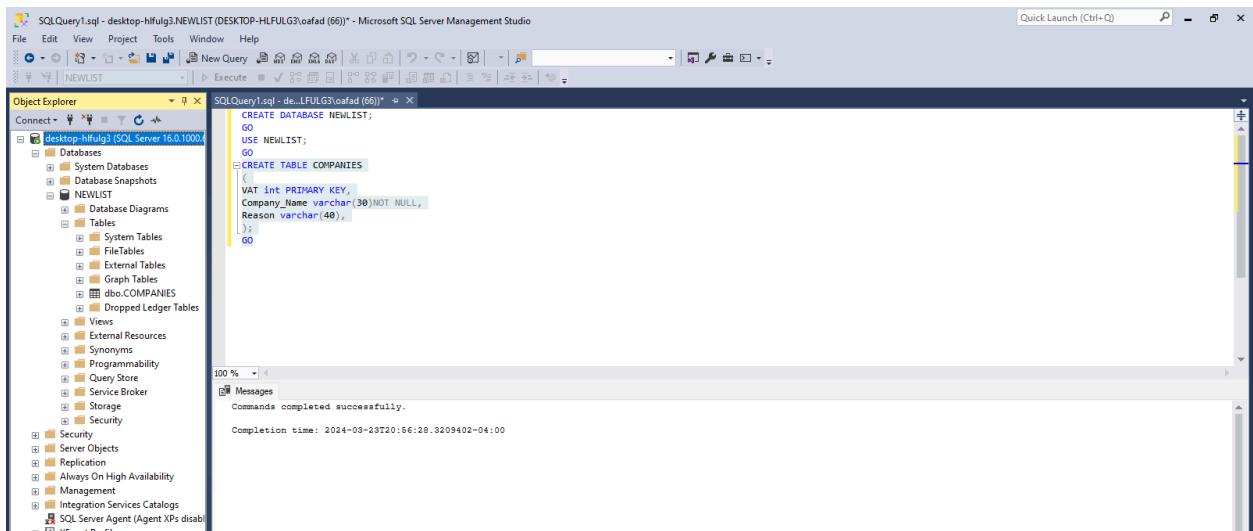

Next task was to create a new list within the Database after the input of proper query

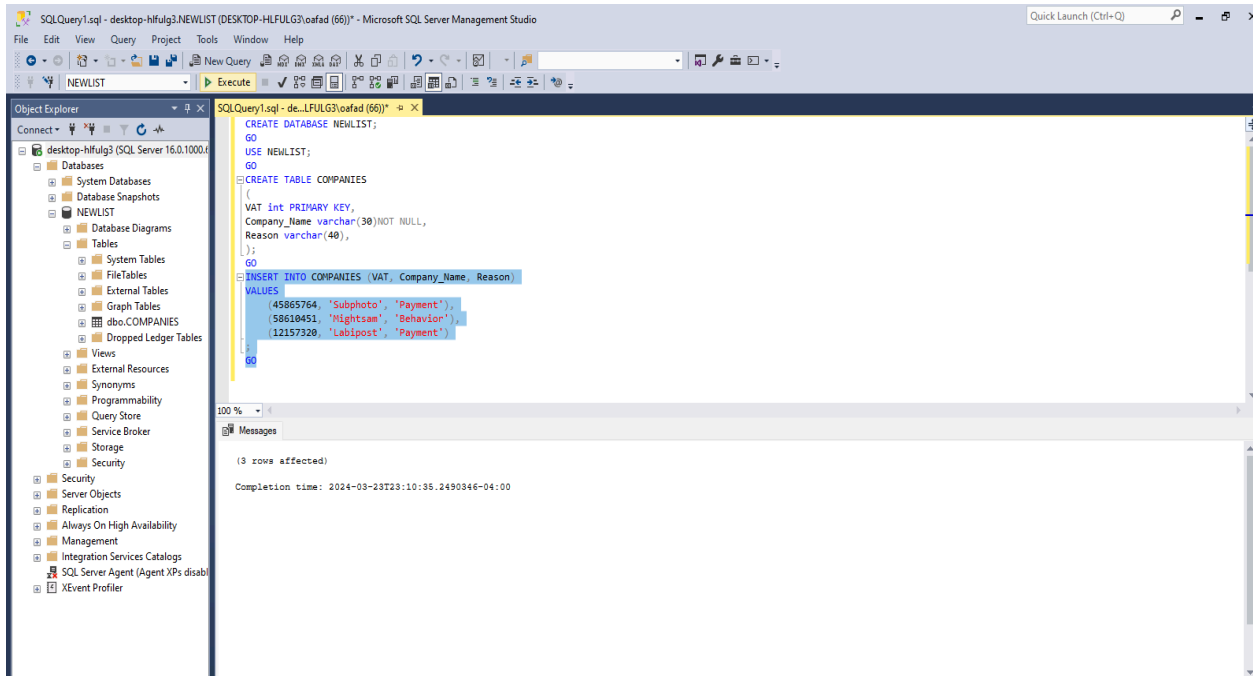

Next was execute query so I am able to form database in SQL server

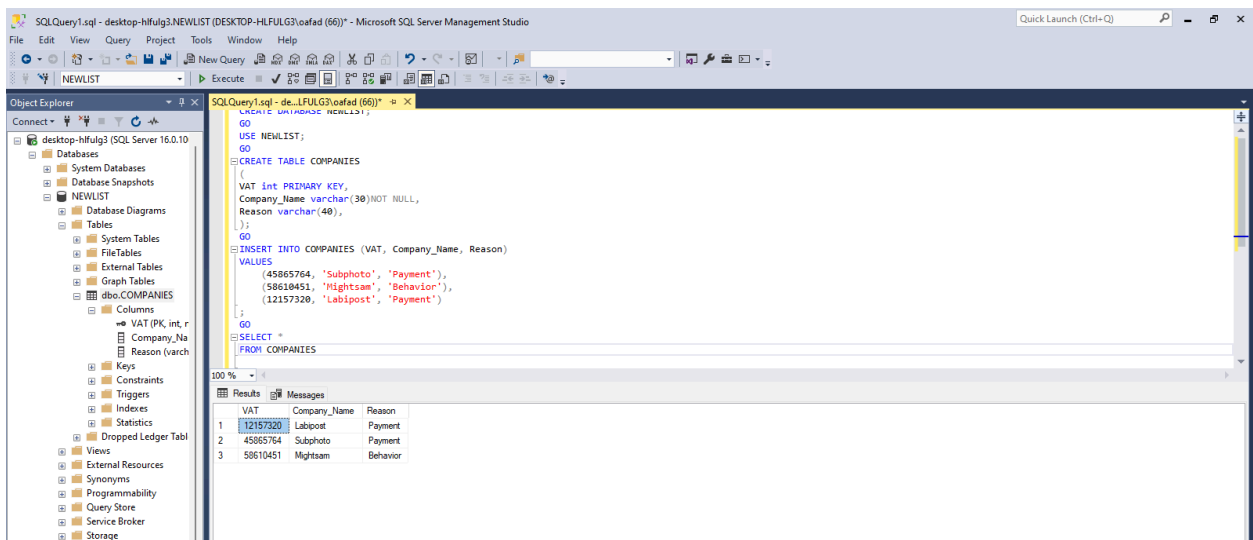

The following task was to input data to create table

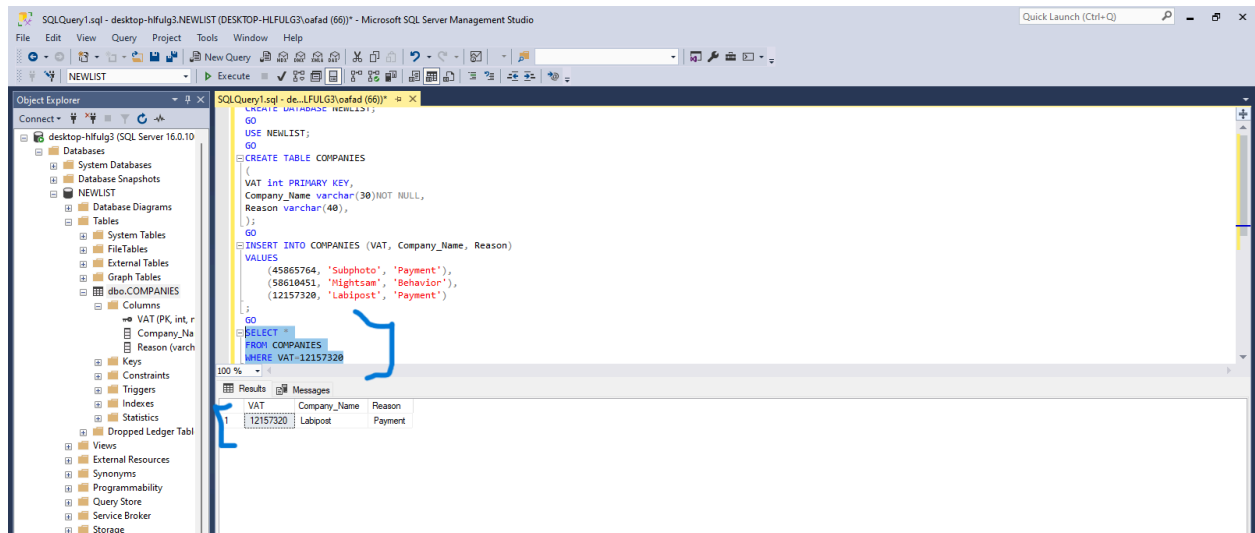

Next was to create queries for the rows within the database

Next step was configure datatable to generate the results needed

Next step was to configure highlighted query to execute desired result in datatable

This was fun lab with being able to configure different queries and create tables within SQL Management studio. This gave me good practice implementing new queries and gave me a chance to execute the tasks needed.
