# Event Viewer

In this lab I was able to perform system monitoring within the Event Viewer in windows to check and filter logs to properly monitor for events.
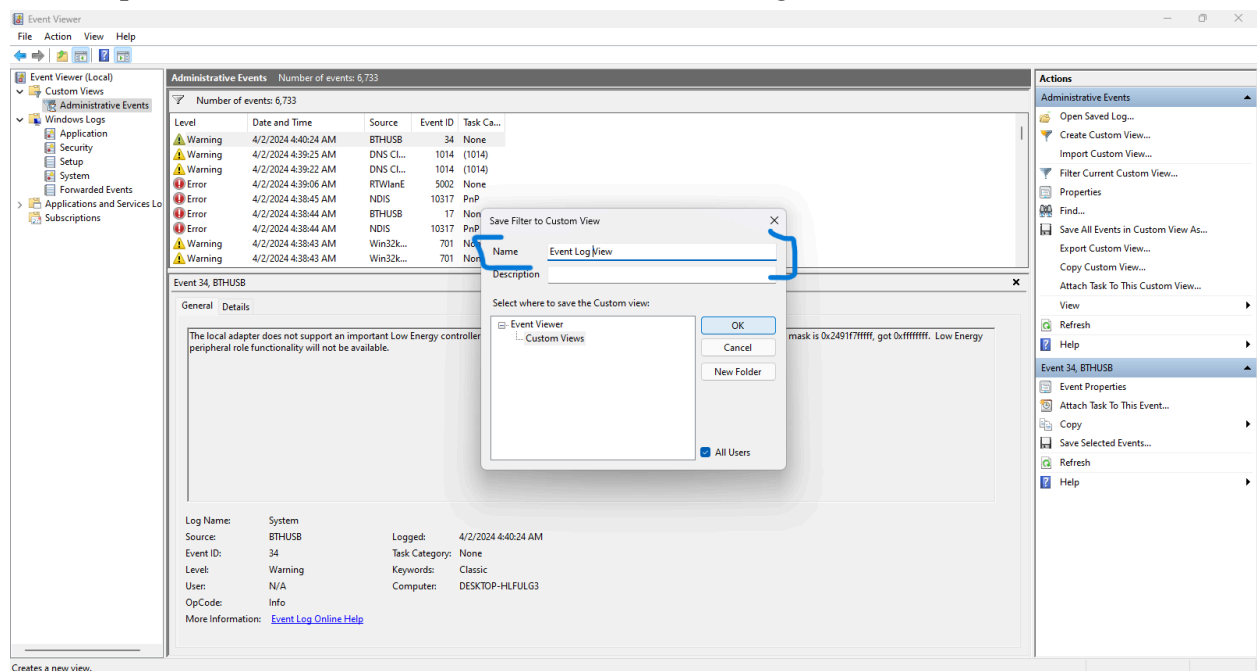

The first task was to open Event Viewer and view events all events in the system

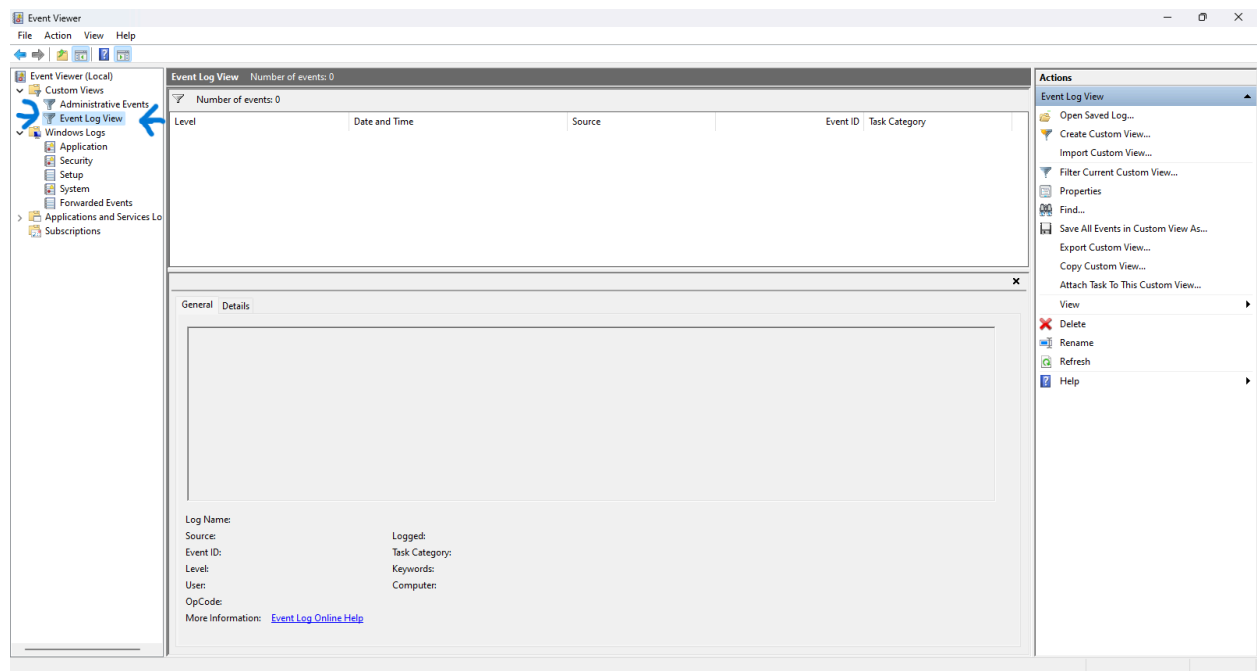

The following task was to create a custom view that filtered my specific logs that I want my system to monitor. Here I wanted my system to filter critical, warning, and error events in the last hour within windows.

Next step was to create a new viewer named "Event Log View"

New viewer created displayed, that matches the filter we want our system to monitor:

In this event viewer lab I created a custom viewer that would help filter events of issues that may be presented when an end user encounters an issue on their PC. Customizing the events in ideal time frame created as well as filtering the event viewer level gives me refined search to help troubleshoot and resolve the issue for the end user.
